

# ***Forward Deployed Engineer — Take-Home Assignment***

## ***Overview***

This exercise is designed to simulate a real-world scenario you might encounter as a Forward Deployed Engineer—working with ambiguous requirements, building a quick solution, and clearly communicating your thinking.

We're not looking for a perfect or production-ready system. We care more about **how you think, structure problems, and communicate decisions**.

## ***The Task:***

Choose a **real or hypothetical business problem** where an AI agent or LLM-based workflow could create meaningful value.

You will:

1. Define the problem
2. Build a lightweight prototype or workflow
3. Explain your approach in a short video (5-8 min)

## ***What to Build:***

Create a simple prototype that demonstrates your idea. The prototype must be runnable and include sufficient code to demonstrate basic engineering proficiency. This could be:

- a small app
- a script or notebook
- a prompt + tool workflow
- or even a well-structured mock system

Focus on clarity and usefulness over completeness.

## ***Video Walkthrough (5-8minutes):***

Record a walkthrough (e.g., [Loom](#)) covering:

### **1. Problem Framing**

- What problem did you choose?
- Why is it important?
- Who is the user?

## 2. Solution Overview

- How does your solution work?
- What does the agent do?

## 3. How You Structured It

- How did you design your “agent” or workflow?
- What components are involved (prompts, tools, data, logic)?

## 4. Tradeoffs & Limitations

- What are the weaknesses of your approach?
- What assumptions did you make?

## 5. Iteration & Learning

- Describe at least one thing you tried that didn’t work and why
- What would you improve with more time?

### ***Deliverables:***

- Link to your video walkthrough
- Link to repository which must include a [README.md](#) with clear set up and run instructions.

### ***Time Expectation:***

We recommend spending **no more than 3–5 hours** on this.

### ***Tips:***

- Keep it simple and focused
- Be explicit about your reasoning
- Don’t hide imperfections—discuss them
- Show us how you think
